WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (1).

MORBIDITY DATA

Admissions are reported only for cases admitted to a medical installation (either to hospital or quarters) and not returned to duty within the same day, except for certain cases carded for record only (chiefly venereal disease cases treated on duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all "new" traumatizations (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, as well as various types of wounds not due to enemy action) other than battle casualties. Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. It may be noted that under the term infectious hepatitis are included cases reported as jaundice and cholangitis. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. More significant is the estimated non-effective rate for personnel stationed in the United States shown in the chart on page 7.

The number of enlisted men discharged during the week on Certificate of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharge prior to April which were processed in May).

In making comparisons between Service Commands it should be borne in mind that morbidity rates naturally tend to be higher in those Service Commands which have a relatively large number of General Hospitals and Port of Embarkation. The presence of sizeable numbers of troops not under the jurisdiction of a Service Command (e.g. casualties, task force troops, etc.) affects the interpretation of the data from the viewpoint of Command responsibility.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table. It should also be noted that reception, redistribution, and separation centers frequently report relatively large numbers of admissions arising from routine physical examinations of large bodies of troops.

EXPLANATORY MATTER

In reading the detail tables, it should be born in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

Morbidity from all causes decreased slightly (by 1 percent) during the week ending 15 June, being reported at 567 per year per thousand strength. The current week's admission rate is 2 percent higher than that for the corresponding week of 1944; this is the fourth time this year that morbidity has been higher than in the corresponding week of 1944. Morbidity from disease also decreased slightly being reported at 515 per thousand.

The admission rate from injury decreased to 52 per thousand. It should be borne in mind that the injury rates reported since October 1944 are not strictly comparable with those prior to that time because of the directive (issued 29 September 1944) which provided for the reporting of injuries existing prior to entry into active service and of readmissions for injury under "disease" rather than under "injury," as was formerly done.

Respiratory Causes:

Morbidity from colds, influenza, etc. was reported at 98 per thousand, or about 8 percent lower than the previous week, and the lowest rate recorded since November 1944. The current week's rate is 25 percent higher than that for the corresponding week of 1944.

The admission rate for pneumonia decreased sharply to 9 per thousand which is nonetheless above the rate reported for the corresponding week of 1944.

Common Communicable Diseases:

Morbidity from venereal disease, excluding cases contracted prior to entry on active service increased slightly to 43 per thousand. This reflects in part

the normal cyclical trend during the month since the lowest rate usually occurs during the first week, followed by a steady rise thereafter until the end of the month. The current week's rate is higher than the highest rate reported during any week of 1944.

The admission rate from diarrhea and dysentery decreased to 7 per thousand, continuing the low seasonal level anticipated for this time of the year.

The number of new cases of measles decreased by 20 percent, while the number of new cases of mumps fell by 25 percent and the number of new cases of scarlet fever by 50 percent. The number of new cases of infectious hepatitis increased to number 193, which is almost the highest so far this year.

VARIATION IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

The disease admission rate decreased in all Service Commands except the Third, Fifth, and Sixth and MDW; only in the Third Service Command did the increase exceed 10 percent. All of the decreases were 5 percent or less.

The Ninth Service Command reported the highest morbidity from all causes (603 per thousand) and from disease (556 per thousand). The lowest admission rates from all causes (about 530 per thousand) and from disease (about 490 per thousand) were reported by the Fifth and Seventh Service Commands.

The Fourth Service Command reported the highest morbidity from injury (69 per thousand). All other Service Commands except the Eighth reported rates of 50 per thousand or less.

COMMENT ON CURRENT TRENDS (CONT'D)

Respiratory Causes:

Morbidity from colds, influenza, etc. decreased in almost every Service Command. Decreases of over 15 percent were registered in the Second and Eighth Service Commands. The highest morbidity from these causes was reported by the Ninth Service Command (124 per thousand), while the lowest was registered by the Fourth Service Command (77 per thousand). All Service Commands except the Fifth, Sixth, Seventh, and Ninth had rates under 100 per thousand.

The admission rate from pneumonia decreased sharply in the Third, Fourth, and Eighth Service Commands. The Eighth Service Command nonetheless reported the highest morbidity from this cause (13 per thousand).

Common Communicable Diseases:

Morbidity from venereal diseases, excluding EPTS cases remained about the same in most Service Commands. The sharpest increases (20 percent or more) were reported by the Seventh and Third Service Commands, while decreases of this amount were reported by the Sixth Service Command and MDW. The highest morbidity from these causes was in the Third Service Command (60 per thousand).

Exceptionally low morbidity from diarrhea and dysentery was reported in every Service Command, with none reporting a rate in excess of 10 per thousand. The number of new cases of infectious hepatitis increased sharply in the First, Second, and Third Service Commands.

NON-EFFECTIVE RATE:

The non-effective rate for personnel stationed in the continental United States is estimated at 30.3 per thousand strength for the week ending 15 June as compared with approximately 30 per thousand for the corresponding week of 1944. The mean number of non-effectives in this country, including evacuees from overseas, rose to 101.7 per thousand.

PATIENTS REMAINING UNDER TREATMENT: 15 JUNE 1945

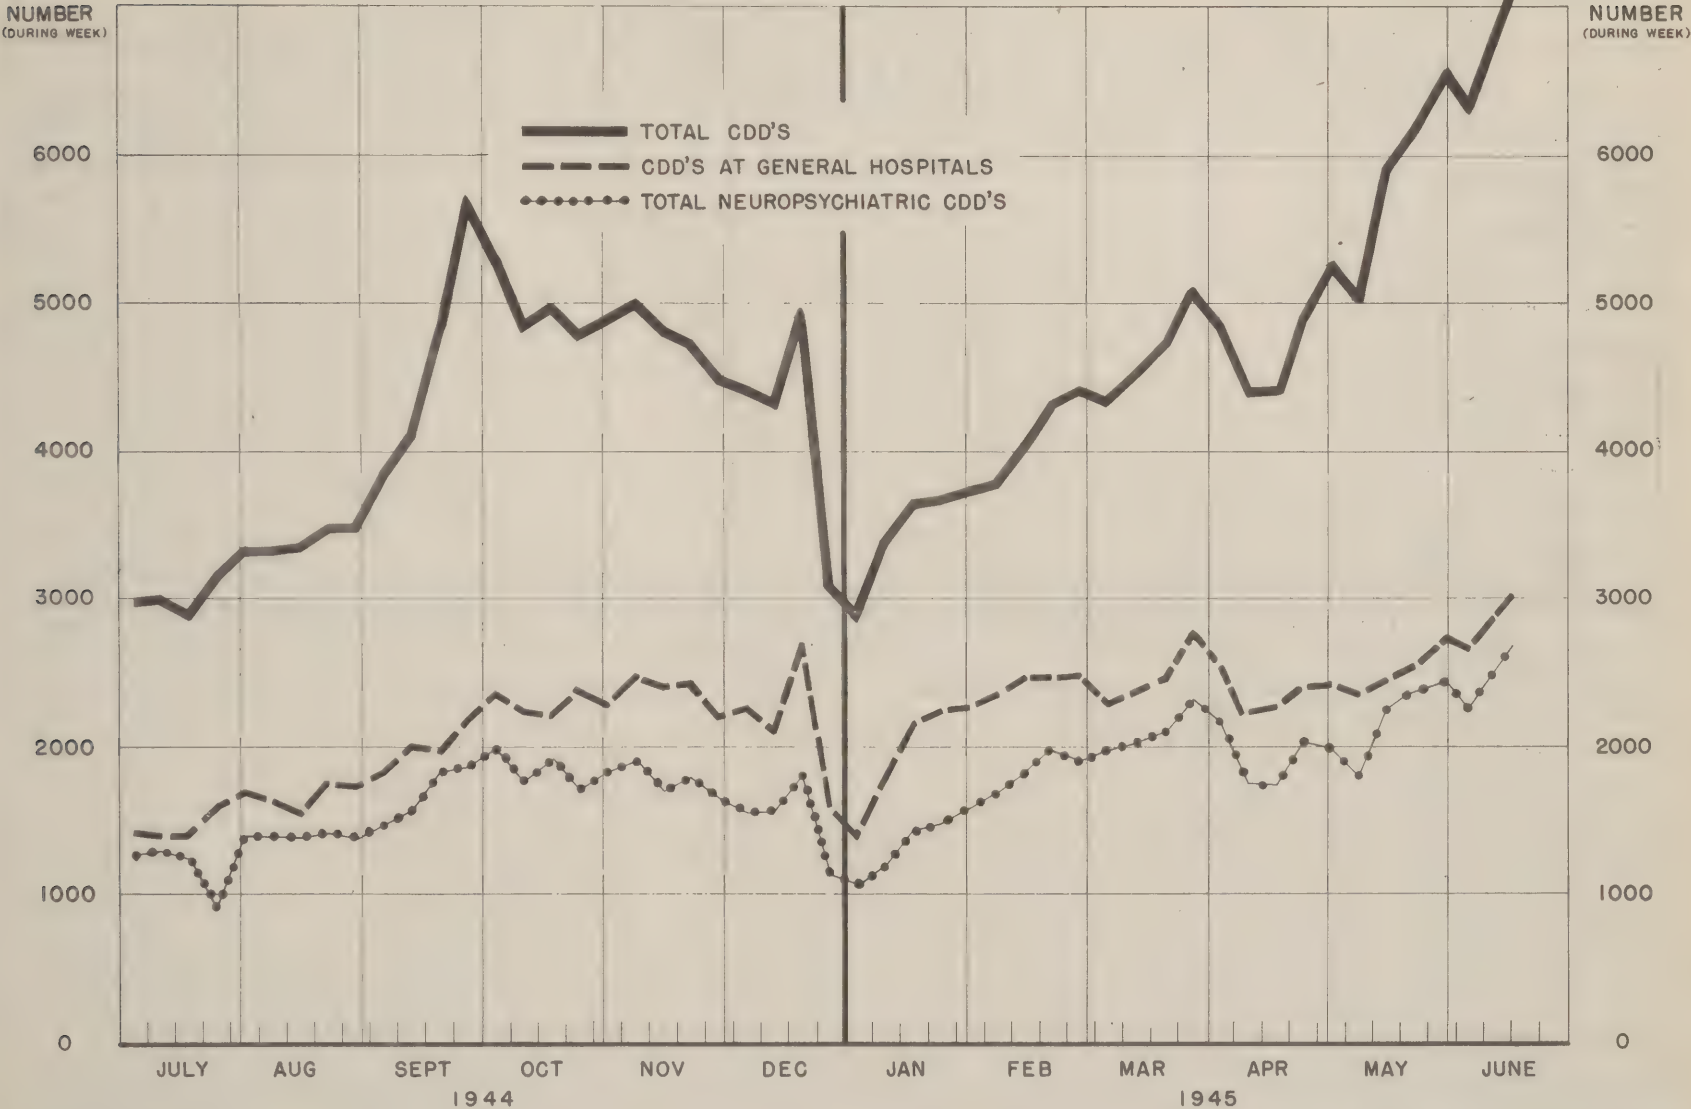

The number of neuropsychiatric cases remaining was 38,513 or about 300 less than at the end of the previous week. Non-battle injury patients remaining numbered 52,000. The number of battle casualty patients remaining increased by about 2,900 to number 106,130.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 15 June there were 7,102 enlisted personnel discharged by CDD or about 800 more than the previous week. About 42 percent of these discharges were reported by General Hospitals and 33 percent by Convalescent Hospitals. Included among the 7,102 CDD's were 2,686 neuropsychiatric cases.

FORM 96-902 - 8 July 1944

RESTRICTED

COMMENT ON RECENT DEVELOPMENTS

FOR THE FOUR WEEK PERIOD ENDING 25 MAY 1945

NATURE OF THE DATA:

The data of this Monthly Report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the four week period ending 25 May 1945 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This Report covers morbidity and mortality data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal diseases and for neuropsychiatric cases.

Charts showing morbidity trends from all causes, from all diseases combined, from injury, and from colds, influenza, etc. are presented on page 25. Similar charts for specified diseases appear on pages 27, 29, and 31. A chart showing mortality trends is presented on page 33. A summary for the month of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 34. The most pertinent morbidity data for individual stations are presented on pages 35 to 58. On pages 59 and 60 the seven stations with the highest rates of admission during the month are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases. Attention is directed to the definitions of admissions and admission rates and the discussion of the proportion of total Army strength included in the stations covered by this Report as given on page 2. The term "month" in this report is used to denote the four or five week period based on the number of Fridays in the calendar month.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY:

The admission rates from all causes and from disease for the Army in the continental United States decreased fractionally in May. The Navy shore stations in this country also reported about the same morbidity in May. The Army's admission rate from disease during May (541 per thousand) was about 1 percent higher than for May 1944.

The admission rate from injury increased slightly in May to 49 per thousand which is almost the lowest rate on record. However, the recent experience is not strictly comparable with that prior to October 1944 because the relatively low level of injuries since that time reflects in part at least compliance with the directive issued 29 September 1944 which required readmitted and EPTS injuries to be reported as "disease" and not as "injury".

Most Service Commands reported about the same morbidity from disease during May as in April. The largest decreases (about 5 percent) were registered in

COMMENT ON RECENT DEVELOPMENT (CONT'D)

the First and Third Service Commands, while the only appreciable increases occurred in the Fourth and Fifth Service Commands (about 3 percent).

The Second Service Command again reported the highest morbidity from all causes and from diseases (both rates, however, being only about 10 percent higher than for the country as a whole). The lowest admission rate from all causes and diseases were again registered in the Military District of Washington (about 10 percent lower than for the entire country), followed closely by the Fifth Service Command. All causes admission rates within 3 percent of that for the total United States were reported by every Service Command except the Second, Fifth, and Seventh and the Military District of Washington. It may thus be noted that there was relatively little spread between the morbidity rates of the Service Commands having the lowest and highest rates, although in previous years the range of variations, even though narrowing during the spring months, was generally much wider.

The admission rate for injury remained substantially the same in all Service Commands with none reporting a change in excess of 10 percent. The highest morbidity from injury during May was reported by the Fourth Service Command (59 per thousand), closely followed by the Eighth Service Command. Most of the other Commands reported rates of 40 per thousand or less.

RESPIRATORY DISEASES:

During May the admission rates for colds, influenza, etc. increased slightly in contrast to the previous downward trend since February. The current month's morbidity was somewhat higher than during the corresponding month of 1944, although in previous

months of this year the experience had been considerably lower than in 1944. Morbidity from respiratory diseases at shore stations of the Navy in this country decreased by about 10 percent during May, although the level experienced in the Navy was still somewhat higher than the Army.

Morbidity from colds, influenza, etc. remained about the same in most Service Commands. Increases of 10 percent or more were registered in the First, Third, Sixth, and Seventh Service Commands and the Military District of Washington. On the other hand, no Command reported a decrease in excess of 10 percent, although the two largest ones, the Fourth and Eighth, reported small decreases. The Sixth and Seventh Service Commands reported the highest admission rates (about 150 per thousand). The lowest morbidity was reported by the Fourth Service Command (101 per thousand).

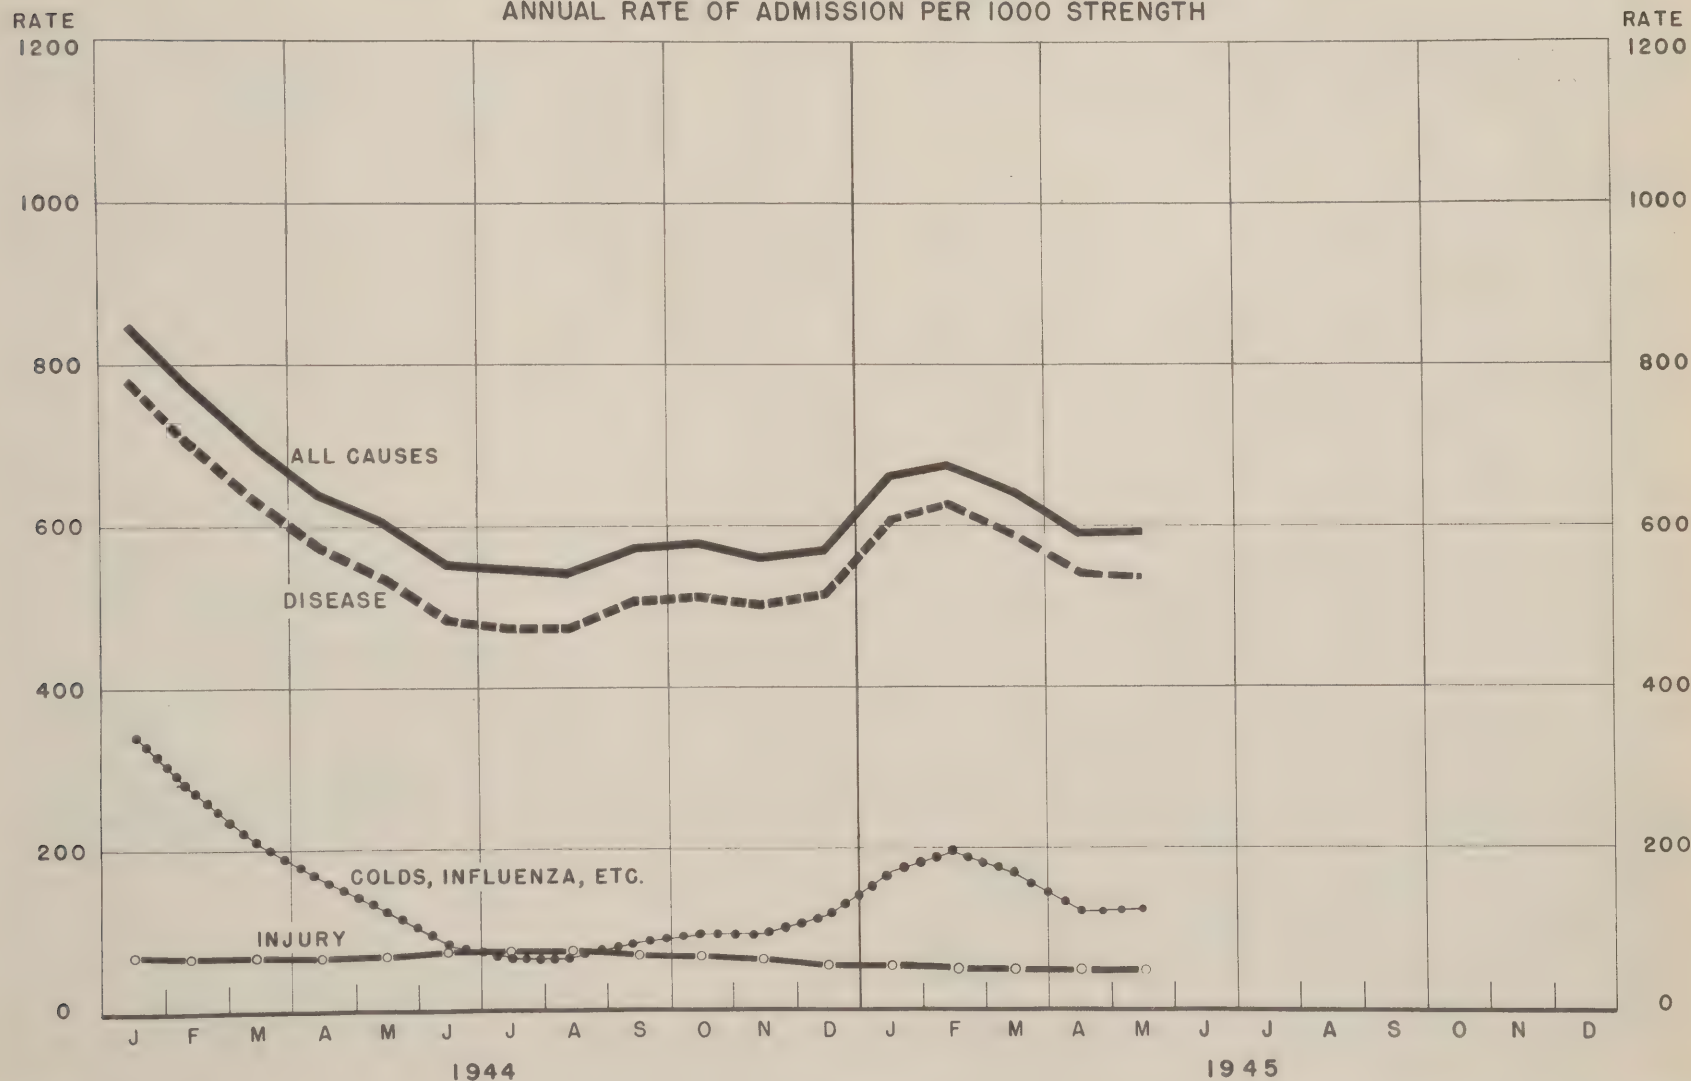

Morbidity from all forms of pneumonia combined remained about the same in May as in April. The admission rate for May 1945 was about 10 percent higher than for May 1944. Most of the Service Commands reported about the same experience in May as in April, although the Eighth did register a significant increase. As a result, this Command had the highest morbidity rate for this cause (19 per thousand), closely followed by the Fifth Service Command.

In May, atypical pneumonia accounted for over 70 percent of all pneumonia admissions. The proportion of pneumonia cases diagnosed as atypical was highest in the Fourth and Eighth Service Commands and the Military District of Washington, in all of which it exceeded 75 percent.

MORBIDITY FROM — ALL CAUSES — DISEASE

— INJURY — COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES
ANNUAL RATE OF ADMISSION PER 1000 STRENGTH

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

DIARRHEA AND DYSENTERY:

Morbidity from diarrhea and dysentery increased slightly in May, but was at about the lowest level reported so far during this war. The admission rate for May 1945 was about 20 percent lower than for May 1944. No Service Command reported a rate in excess of 9 per thousand.

VENEREAL DISEASES:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, increased slightly during May and was about 40 percent higher than for May 1944, and, in fact, higher than for any month of 1944. The Navy's morbidity for venereal disease during May was at a higher level than during April and also higher than for any month this year; the Navy's current experience from this cause is, however, at about the same level as the Army's.

The admission rate for syphilis, excluding EPTS cases, decreased about 10 percent in May to the lowest point reported since October 1944. The admission rate for venereal disease other than gonorrhea and syphilis remained at 1.1 per thousand.

Most Service Commands reported about the same morbidity from venereal disease, excluding EPTS cases, in May as during April. The Seventh Service Command was the only one to report an increase of more than 10 percent, while a corresponding decrease was shown only by the Second Service Command. The highest rate in May was reported by the Third Service Command (60 per thousand), with no other Commands having a rate of 50 per thousand or more. However, only the Eighth and Ninth Service Commands and the Military District of Washington had rates of less than 40 per thousand.

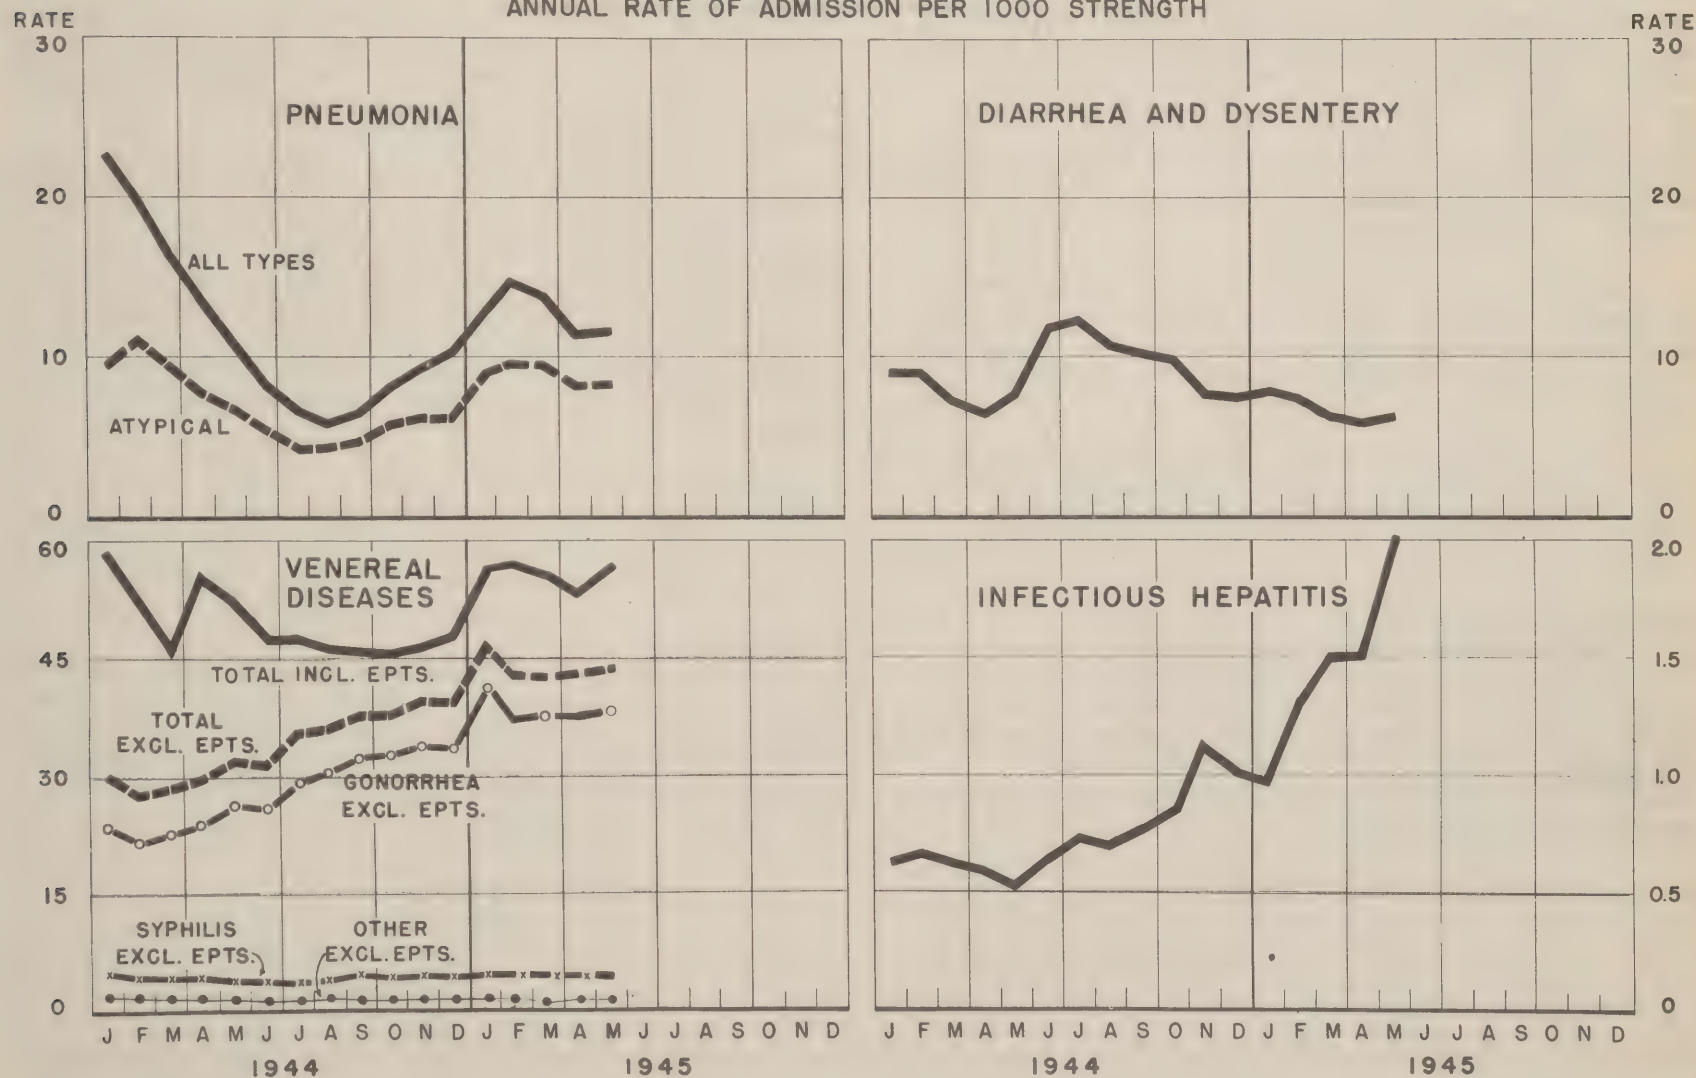

The venereal disease cases remaining under treatment on 25 May are shown below:

Service Command	Number Remaining Under Treatment		Venereal Disease Cases as Percent of All Cases	
	Syphilis	Other	Syphilis	Other
TOTAL U.S.	1297	797	.46	.28
I	70	15	.5	.1
II	43	46	.2	.2
III	133	121	.5	.5
MDW	10	40	.3	1.1
IV	331	199	.6	.3
V	55	67	.2	.2
VI	14	18	.1	.1
VII	97	39	.3	.1
VIII	338	157	.8	.4
IX	206	95	.5	.2

The great bulk of the cases remaining were contracted after entry on active service. The number of syphilis cases remaining at the end of May was 12 percent lower than for April, while the number of cases of other venereal diseases increased about 5 percent. Total venereal cases represented .74 percent of the total number of patients remaining under treatment in hospital. The very much longer duration of hospitalization for syphilis is indicated by the fact that only 9 percent of the total venereal admissions (excluding EPTS cases) were for this cause, even though 62 percent of the cases remaining under treatment were syphilis cases.

MORBIDITY FROM—PNEUMONIA—DIARRHEA AND DYSENTERY VENEREAL DISEASES—INFECTIOUS HEPATITIS

CONTINENTAL UNITED STATES
ANNUAL RATE OF ADMISSION PER 1000 STRENGTH

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

Morbidity represented by venereal EPTS cases was reported at 13.0 per thousand during May as compared with 11.7 per thousand for April. Variations in the admission rate for venereal EPTS cases as between Service Commands have relatively little significance, because they reflect a different geographical and racial distribution of Army personnel as compared with that of new inductees. The average weekly number of venereal EPTS cases in May was 713 as compared with 631 in April, reflecting the trend of the number of men inducted into the Army.

The total days lost from duty during May because of venereal disease were about 56,000 or an average of 14,000 per week; this represented a non-effective rate of .70 per thousand as compared with .76 in April.

Detailed data as to the May incidence of venereal diseases by color will be presented in a Special Health Report to be contained in Weekly Health Report No. 25.

MENINGOCOCCIC MENINGITIS:

Morbidity from meningitis remained at about the same level as during the previous four months (about .6 per thousand). The current experience is only about one-half as high as that during the corresponding period of 1944. The Fifth Service Command continued to be the only one to report relatively high morbidity from this cause.

INFECTIOUS HEPATITIS:

Morbidity from infectious hepatitis increased by almost 50 percent to 2.2 per thousand which is the highest rate reported since the epidemic in the summer of 1942. The Second Service Command with a rate of 7.4 per thousand reported the highest morbidity from this cause, followed by the Fifth and Sixth Service Commands with rates of about 4 per thousand.

MEASLES:

Morbidity from measles decreased only slightly during May but, nevertheless, was about 50 percent below the corresponding rate experienced for May 1944 and also about 10 times the minimum rate which may be anticipated during the late summer months. The Eighth Service Command was the only one to report an admission rate in May notably in excess of that for the entire country.

MUMPS:

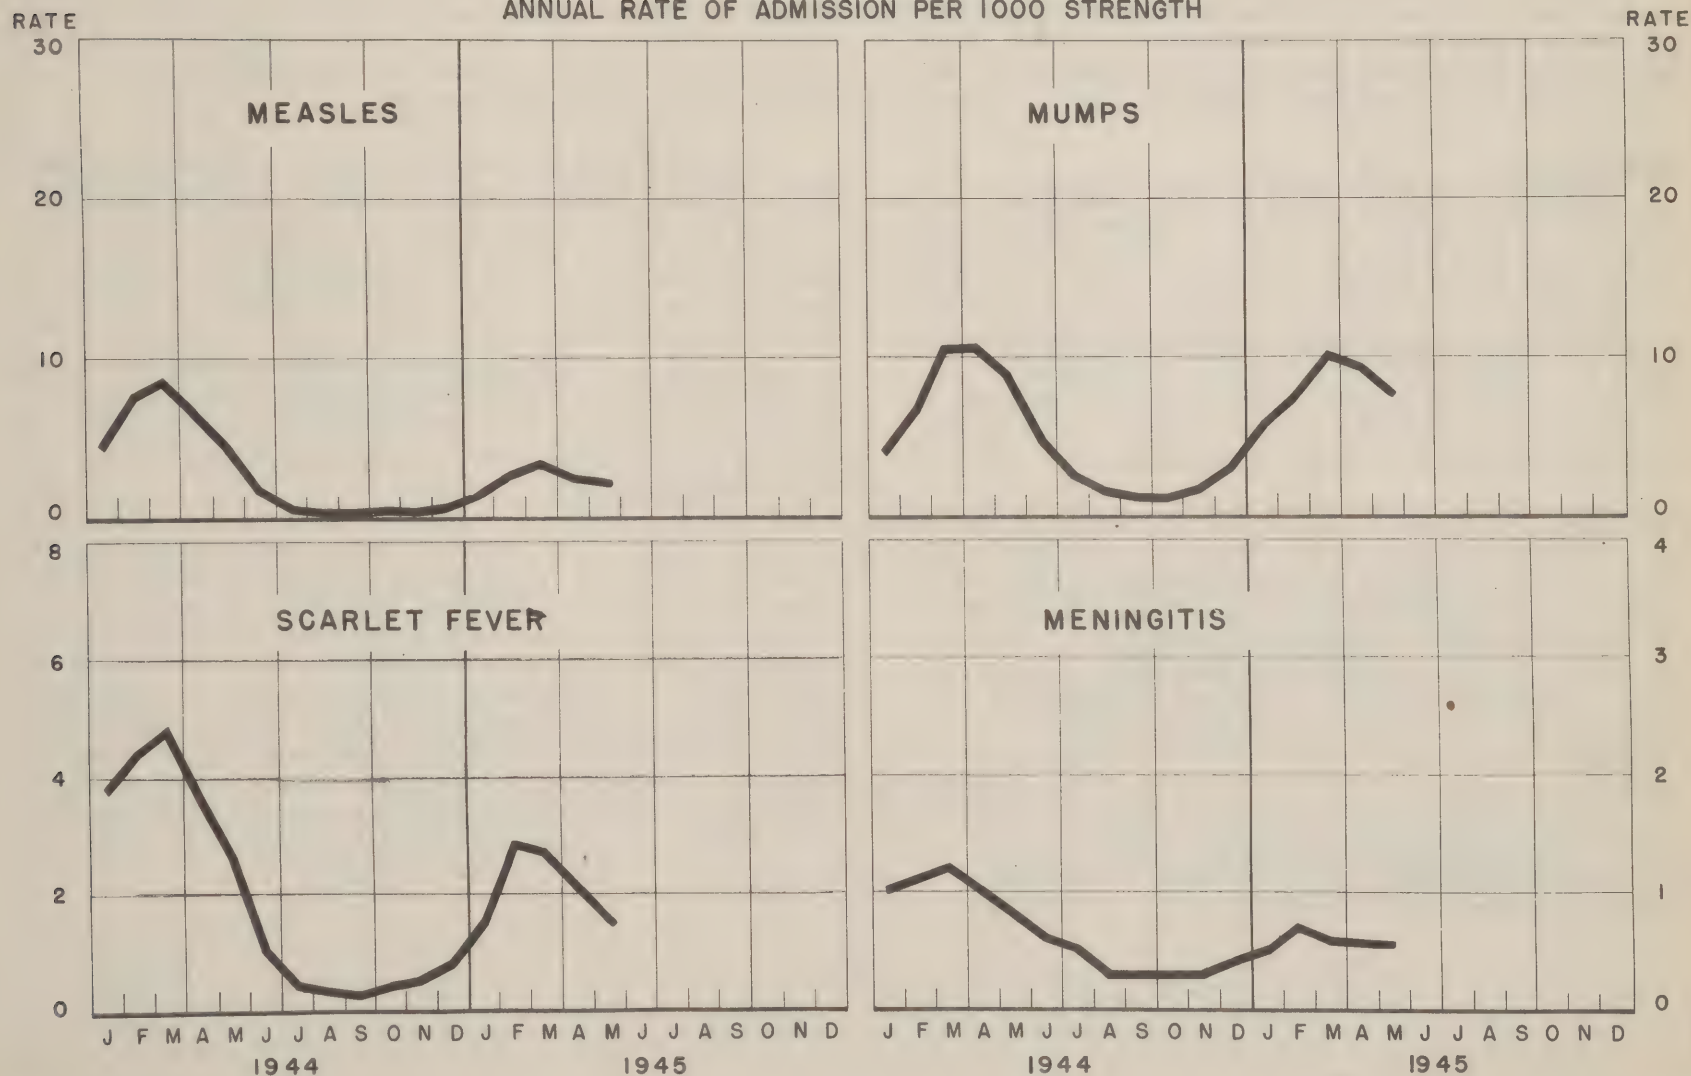

Morbidity from mumps decreased by almost 20 percent in May to 7.6 per thousand. This rate is about 15 percent below the corresponding figure for May 1944.

SCARLET FEVER:

Morbidity from scarlet fever decreased by about 30 percent in May to be reported at 1.5 per thousand. The admission rate for May 1945 was about 40 percent lower than for May 1944. Only the Sixth and Seventh Service Commands reported rates notably in excess of that for the entire United States.

MORBIDITY FROM — MEASLES — MUMPS SCARLET FEVER — MENINGITIS

CONTINENTAL UNITED STATES
ANNUAL RATE OF ADMISSION PER 1000 STRENGTH

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

RHEUMATIC FEVER:

Morbidity from rheumatic fever increased slightly for the third consecutive month, being reported at 1.3 per thousand which is the highest recorded since July 1944. The Eighth Service Command reported the highest morbidity from this cause (2.0 per thousand).

TUBERCULOSIS:

Morbidity from tuberculosis was reported at .9 per thousand in May or a notable decrease from the rate of 1.2 per thousand in April. The current relatively high level arises in large part as the result of examinations at separation centers which tend to uncover cases which otherwise would be undetected. As of 25 May there were 2096 cases of tuberculosis remaining under treatment representing .7 percent of all patients in hospitals. Of the total cases, 996 were at Fitzsimons GH and 597 at Bruns GH.

MALARIA:

Morbidity from malaria acquired outside the United States was reported at .1 per thousand in May. The number of cases presumably acquired in the United States, which were admitted (or readmitted) for treatment in this country averaged about 1350 per week or roughly the same as during the previous three months and, thus, the highest figure so far recorded.

As of 25 May, there were 3194 cases of malaria under treatment, representing 1.1 percent of all patients in hospital. Only 17 cases were those where the disease was acquired in this country.

NEUROPSYCHIATRIC DISORDERS:

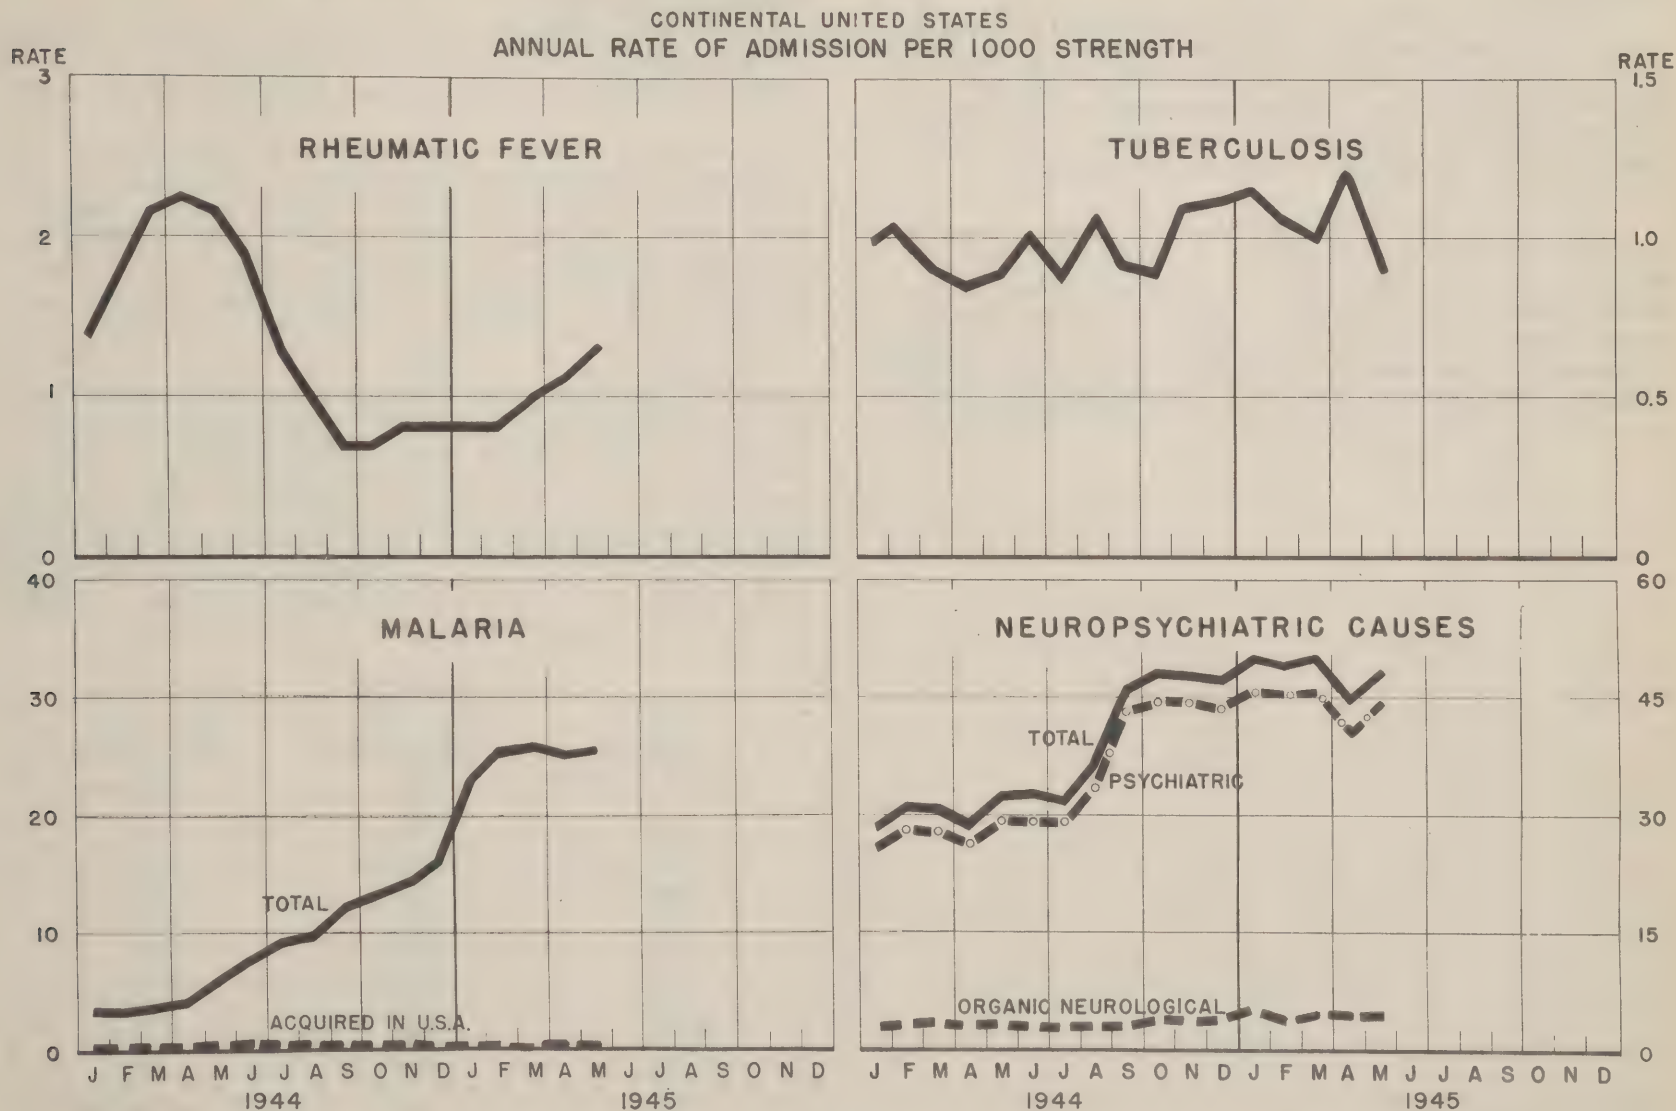

The annual rate of admission for neuropsychiatric disorders increased by almost 10 percent in May to 48.6 per thousand. Since August 1944 morbidity from this cause has fluctuated within the relatively narrow limits of 45 to 50 per thousand.

During May there was an average of 2110 CDD's per week given to enlisted men classified as neuropsychiatric cases, or about 10 percent higher than the weekly average for April. The CDD's in May for men with neuropsychiatric disorders represented 39 percent of all CDD's or somewhat lower than in April (41 percent).

In May, organic neurological cases accounted for 9 percent of all neuropsychiatric cases. Only in the Second and Fifth Service Commands did the proportion of organic neurological cases exceed 15 percent of the total neuropsychiatric cases.

The number of neuropsychiatric cases remaining under treatment as of 25 May was 37,640 or about 2,000 more than at the end of April and thus the highest number reported so far during this war. During May the number of locked ward cases increased by about 10 percent, while the open ward cases increased by 5 percent. Most of the rise in neuropsychiatric cases remaining was reported by the Second, Fourth, and Eighth Service Commands. Neuropsychiatric cases remaining represented 13.2 percent of all patients in hospital, with open ward cases being 11.4 percent and locked ward cases 1.8 percent.

MORBIDITY FROM — RHEUMATIC FEVER — TUBERCULOSIS MALARIA — NEUROPSYCHIATRIC CAUSES

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

MORTALITY:

Mortality from all causes during May was reported at 2.40 per year per thousand strength. The mortality rate from disease increased from .74 per thousand in April to .83 per thousand in May, while the reported mortality rate from injury decreased from 1.52 per thousand to 1.46 per thousand.

It should be noted that the reporting of deaths on Forms 86ab is not complete, particularly for deaths from injury for which the understatement may be as great as 15 percent. The mortality rate from injury when adjusted to allow for this under-reporting is about 1.7 per thousand, resulting in an estimated total death rate from all causes of 2.5 per thousand.

NON-EFFECTIVE RATE:

The non-effective rate for Army personnel stationed in this country was about 33 per thousand in May or slightly lower than the revised figure of 34 for April.

The mean number of non-effectives (including evacuees from overseas) for May was reported at 97 per thousand strength or 6 percent higher than in April; most of this increase arose because of an increase in hospital population at General and Convalescent Hospitals. The mean number of injury non-effectives per thousand strength in May was 16.8 per thousand.

Variations in the mean number of non-effectives per thousand strength by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General and Convalescent Hospitals in each Service Command. When comparisons are made between the rates excluding such hospitals the variations by Service Command are seen to be very much smaller than when the days lost in these hospitals are included, as evidenced in the table below:
